

Weekly Reflection

Monday delivery

This week's objective

Onboarding the SailGP SIM

Step 1 — Five observations

From your sessions this week, list five things you noticed — good or bad. From your perspective as helm, what stood out in relation to this week's objective? Don't filter yet. Just capture.

1

ttk is a reliable time for manouvering when ratio plumbers when entering late. 15 for a normal and 17 when in complicated situations(not taking in consideration polar gain)

2

polars always gaining, specially with stronger winds and on foil.

3

manouvers at the back not realistic.
Every time you are out of range real sailing it takes much more to accelerate and get up to speed, and/or angle.

4

time to the line helps trigger pulls on the close to line situations.

5

box Portsmouth seemed quite big 47 seconds into the box and not close to the back.

Step 2 — Filter

Look at your five observations. Ask yourself:

1. Which of these happened more than once?
2. Which one — if improved — would have the biggest impact on our real-world starts?

The one observation I am taking forward:

using ttk for a better idea on ttk out of the tack 30 for a stand by.
17 for a hard situation boat on boat. 15 for a good tack in the cloud not taking in
consideration polar gain.

Step 3 — Why it matters for our real-world starts

Connect your chosen observation directly to the end goal: improving our starts on the water.
If you can't make this connection clearly, it is not the right observation.

Why this matters:

we've been missing the key detail that is how late we can be without losing the timing to the start.
NY we saw a good attempt at that and I want to study a bit more the out of range situations(ex Perth average ttk was 20)

Step 4 — Share it

How can others verify this is true — not just your experience? A screenshot, a clip, a timing number, a moment others will recognise.

Evidence (screenshot, clip, or description others can verify):

Perth ttk and Abu Dhabi

Step 5 — Proposed solution or next action

What should change? Could be a sim setting, a training approach, a communication pattern, or a question for someone else to answer.

Solution or owner:

goodie

Your hypothesis:

If we see a clear tack we can push the ttk, within _____,
then _____ will improve,
because _____.

Same questions every week. The objective changes. The process doesn't.
